TITLE : CARD WITH BUILT-IN NON-CONTACT
IC AND METHOD FOR FORMING
REWRITE PRINTING FACE

ABSTRACT : PROBLEM TO BE SOLVED: To attain the rewrite of information print corresponding to the rewriting of memory information corresponding to the memory life of a card with a built-in non-contact IC.

SOLUTION: Leuco dye is applied to the surface of a film 3b in constant thickness and dried so that a rewrite print face 14 can be formed. A heating temperature for the rewrite print face 14 formed on the surface of the film 3b is controlled so that the two configurations of a light emitting state and a light erasing state can be obtained. Thus, the printing and deletion of information such as characters is operated to the rewrite print face 14 so that it is possible to attain the rewrite of information print corresponding to the rewriting of the memory information corresponding to the memory life of a card 1 with a built-in non-contact IC.
